28 June 2026

VERSION
2.2

1 Purpose of this document

Dear Ramesh anna, thank you for taking the time to walk us through how GV Mart runs. This document sets out our understanding of what you want the new system to do, in plain terms, **before** we begin building. Sections 2 to 5 give the overview, and **Section 6 lists the detailed requirements point by point** so nothing is missed. Please confirm these are correct, answer the two short questions in Section 7, and sign at the end. Anything not captured here can be added later as a change request.

2 What the system covers

Module	What it does
Sales & Billing	Sell products, spares and AMC plans with proper bills, discounts and gifts.
Service Management	Log complaints, auto detect AMC, Warranty or Paid, set priority and fix appointments.
AMC & Warranty	Sell plans, auto schedule periodic service, and send renewal reminders.
Technician App	Attendance, job photos, service checklist, on the spot billing and new enquiries.
Live Location Tracking	See technician movement and whether they reach customers on time.
Customer App	Customers book service and raise enquiries themselves.
Inventory & Purchase	Track stock and auto send purchase orders to suppliers when stock is low.
Staff, Salary & Incentives	Attendance based pay, revenue linked salary, incentives and rewards.
WhatsApp Automation	Auto send videos, reminders and appointment confirmations.
Leads & Follow-up	Capture every enquiry as a lead and track it through to sale.
Reports & Dashboards	Sales, service, expense and staff performance reports.

3 What you can set up yourself

The system includes set-up areas, called masters, where you (the admin) define and update the base information the system runs on. You can change these yourself at any time, without needing us each time. For example:

- Products, brands and models, with their prices.
- AMC and warranty plans, their durations and prices.
- Discount limits and the gift threshold amount.

- Service timings and per kilometre travel time.
- Suppliers and the products each one provides.
- Incentive, reward and reference point values.
- Staff roles and what each role is allowed to do.

4 Built to simplify and automate

Wherever a step can run on its own, it does. Your team handles the judgement; the system handles the repetitive work. The main automatic parts:

- Service type (AMC, Warranty or Paid) is decided automatically.
- AMC periodic service is auto scheduled, and renewal reminders go out automatically.
- When stock runs low, a purchase order is sent to the supplier on WhatsApp automatically.
- WhatsApp sends the right videos, quotations and reminders on its own.
- Every enquiry is captured as a lead automatically, with credit to the technician.
- Incentives, rewards and reference points are calculated automatically.
- A confirmation check happens before a technician starts each appointment.
- The manual diary is replaced by an automatic daily to do list that carries forward.

5 How the main flows work

Sales

Product and spares bought together always get two separate bills.

Service

Staff cannot mark a job as Paid by hand. The system decides automatically.

Technician day

Customer self-service

Customer can raise a Service, Spare, Product or AMC enquiry.

6 Detailed requirements, area by area

This section captures the detail from our discussion, point by point, so nothing is missed before design. Please read through and tell us anything that is wrong or incomplete.

6.1 Sales and billing

- Start by searching the customer by name or number, then choose Sales or Service.
- Under Sales, choose Spares or Product.
- Product sale order: select product, then brand, then model. The price shows. Choose payment method, apply discount, offer gift, offer AMC (RO only), set warranty yes or no with an auto reminder, and ask installation yes or no.
- If installation is yes, a service ticket is raised and assigned to a technician automatically.
- If a customer buys both a product and spares, the system makes two separate bills.
- A gift is offered automatically when the purchase crosses a set amount (for example a water bottle or jute bag).
- Payment is Cash or Bank transfer. For bank transfer, the transaction or ID and a short description are required.
- Discount limits: technician up to 5%, admin up to 10%, above 10% is not allowed at all.
- Everything in a sale is recorded, so reports stay accurate and measurable.

6.2 AMC

- AMC has plans (for example Gold, Silver, Platinum), each for a chosen number of years.
- The price is calculated and shown automatically. More years means a lower rate.
- AMC plans, prices and what each plan includes are kept in the AMC master, which you set.
- AMC service does not charge the customer, but any spare used still reduces stock. AMC does not add to revenue, but it does reduce inventory.
- If an AMC does not cover a part that was used, the system adds that part's price to the bill, and the bill cannot be closed until it is added.
- AMC automatically schedules a service every 3 months, with a description.
- AMC plans are sold only on RO products.

6.3 Warranty

- Warranty service is of two kinds: scheduled (every 3 months by default, counted from the first service date) and unscheduled (for issues that come up after a sale).
- For a new product, after about 10 days some issues can appear that cannot be predicted. These are handled as unscheduled warranty service.
- The system decides automatically, from the customer address, product, brand and model, whether a job is AMC, Warranty or Paid. Staff cannot choose Paid by hand.
- The purchase date is shown. For AMC, the AMC date and expiry are shown.

6.4 Service and complaints

- A complaint records the product, brand, model and the name of the complaint (for example no taste, water leakage, unit not working).
- The name of the complaint is what the customer says (for example AC not cooling). The nature of the complaint is what is found after the visit (for example gas refill needed). Both are captured.
- Each complaint is given a call priority: very urgent, urgent or normal.
- An appointment is set as Always available, or a specific time and date, with exceptions. Working time is 9:00 AM to 7:30 PM.
- If a customer calls many times or with urgency, that is considered when assigning the appointment.
- One person cannot have two open appointments at once. The next is allocated only after the current one is completed.
- Each completed job has a report with the appointment date and time, service start time, service close time, and total time taken.

6.5 Technician app and field work

- When the technician opens the app, they search the address, which shows the customer name and contact number. Touching the number starts the call, and calls are tracked and recorded.
- The customer location is used to navigate to the site.
- The screen shows the Service or Product for that job: product, brand, model, complaint and appointment time, based on customer availability.
- The customer's previous history is shown, along with whether the job is Paid, Warranty or AMC. The technician works based on this.
- For AMC, a scheduled service (for example changing the sponge) shows with no service charge. For paid service, the quantity and cost are shown from the master.
- In warranty and AMC the cost shows as zero, but the quantity is still recorded, to keep inventory correct.
- On arrival, the technician uploads a before image of the current condition. After the work, an after image.
- Each process and each part change has a fixed standard time, set by you. The technician follows it, and exceeding it shows as red.
- The technician selects the spares used by search or by voice (Tamil), then creates the invoice. Technician and customer both sign.
- For RO service the checklist records Before TDS, After TDS and Tank cleaned (yes or no), plus the client name and whether the product was explained.
- If the technician finds a new enquiry (service, product or AMC), it is recorded with a description (voice in Tamil is fine) and saved as a lead in the technician's name. The technician earns incentive on it.
- A lunch break of 30 minutes is allowed. More than 45 minutes shows as red.
- The technician earns incentive for each Google review received, at a value you set.

6.6 Location tracking and dispatch

- After attendance, the technician receives the day's spares (the spare bag), based on the previous day's cumulative invoices. A technician wise spare availability list is maintained.
- Admin and technician both sign for the spares given and received.
- After attendance, the first work is decided, or the technician chooses which job to go to first. Every technician has assigned work.
- A per kilometre travel time is set by you (for example 1 km equals 5 minutes). This is the standard used for tracking.
- If the technician reaches within the expected time, the map shows green (a distance reach indicator). If they take a wrong route or stay somewhere for 5 to 10 minutes, it shows a red box explaining how long they stayed.
- When the technician reaches the location, the productivity timer starts automatically.

6.7 Customer app

- The customer fills their address, then sees Service Booking, Spare Enquiry, Product Enquiry and AMC Enquiry.
- Service Booking is a guided chat with a set of questions. The customer's existing product shows automatically. If not, they can select it. If they do not know, it is added to a service enquiry automatically.
- Product Enquiry can take the customer to the website, or auto send videos and a quotation, then close.
- For AMC, the customer can book the service themselves, only when the renewal date is near. You set how many days before.
- The Google review link is shown to the customer only when they rate 4.5 or 5, not below.
- You can edit these customer enquiry flows yourself, anytime, from the admin section.

6.8 Attendance, salary, incentives and rewards

- Attendance is geo-fenced. It can be marked only inside the office.
- After attendance, the technician ticks the affirmation and pledge, then ticks the meeting.
- If they arrive after 9:15 AM, attendance and the meeting, affirmation and pledge ticks are locked. You can change this time.
- Salary is revenue based. Above a certain revenue, incentive applies, and a higher daily revenue raises the monthly salary on a set scale.
- If a technician is late, a deduction applies based on the late hours.
- Incentives come from extra service income, sales income and reviews. You set these in the incentive master.
- Rewards include on time attendance every day (monthly), highest review (monthly) and highest revenue. You log each reward given.
- Reward thresholds are exact (for example a highest revenue reward applies only at or above the set figure).
- Reference points: a customer reference earns points. You set the value per point (minimum 50), and accumulated points reflect as agreed.

6.9 Leads and WhatsApp automation

- Every enquiry, from the field, the customer app or WhatsApp, is captured as a lead, with its source and the technician's name where relevant.
- An AI WhatsApp agent sends the right video based on the enquiry: an online use video, a price video, a quality video, a customization video, a water premium video or a budget video. You set this flow.
- Leads move from lead to quotation to sale, and the ratio is tracked.

6.10 Inventory, purchase and suppliers

- Each spare and product has a minimum stock and a reorder quantity (for example minimum 10, reorder 10).
- When stock runs low, a purchase order is sent to the supplier on WhatsApp automatically.
- Suppliers are linked to the products they provide. The system knows who can provide what, and sends the order to the lowest cost supplier.
- During bill entry, the previous bill and supplier come up by default.

6.11 Reports and performance

- Sales reports show the number of calls, and the split across product, spare and AMC as ratios.
- Service reports are technician wise, with the average value per call.
- Total revenue includes the technician report.
- A performance scoreboard (KRA, KPI) is built from these inputs.
- Expenses are tracked across marketing, stationery, salary and petrol.

6.12 Operations and sales admin

- A daily to do list works like the manual diary. Completed items close at end of day, pending items move to the next day.
- Wherever possible work is automated, and WhatsApp automation is treated as compulsory.
- Before a technician starts towards an appointment, an agent call confirms it (one check before).
- The admin works through notifications, follow ups, reminders, dashboards and reports.
- Operation Admin is measured on on time complaints (within 24 hours) and same day service. Sales Admin is measured on call ratios. Both earn incentive on these.

7 Points we need you to confirm

- 1 Consumable item.** Please confirm the RO consumable we noted as “spun / sponge” so we name it correctly in the system.

Your answer: **Item name:** _____

- 2 WhatsApp number.** Please confirm which business number will be used. The official WhatsApp approval takes a few weeks, so we should start now.

Your answer: **Number:** _____ **Owner:** _____

8 How we will build it, in stages

Stage 1	Core sales, billing, service logging and inventory. The daily money flow.
Stage 2	Technician app: attendance, live location tracking, job photos, checklist, on the spot billing and call tracking.
Stage 3	AMC and Warranty automation, and the customer app with admin editable enquiry flows.
Stage 4	Salary, incentives and rewards.
Stage 5	WhatsApp automation, auto purchase orders and full reports.

Live location tracking is included from the start of field work, in Stage 2, as soon as the technician app goes live. Each stage is delivered, checked and approved by you before the next one begins.

9 Background services and running costs

Some parts of the system use paid third party services: official WhatsApp, maps and location, the payment gateway and server hosting. These carry small **monthly running costs paid by GV Mart**. We will share the exact list separately so there are no surprises. The software work and these service costs are kept clearly apart.

10 Confirmation and sign-off

By signing below, GV Mart confirms that the requirements, rules and stages described in this document are correct, and that the answers given in Section 7 may be used to lock the project scope and begin development.
